Common module and listing format

This is the structure that all lists of items have in common, both for modules and lists.

```
{
    "control": {
        "page_number": "1",            // The current page number.
        "overall_total": "123",        // total number of items in the data set.
        "page_size": "5",              // The number of items per page.
        "total_items": "4",            // The actual number of items for this page.
        "total_pages": "1",            // The total number of pages.
                                       // Listings and paginated content may vary.
        "pick_id": ""                  // Still being discussed on how this will be used.
    },
    "items": [
        { entity... }
    ]
}
```

Also see the common sub records specification for details of the entities in the items array.

The control structure for unpaginated content will be treated as a single page list, i.e. page_number and total_pages will be 1.
